

The Cost of No New Clean Power in Delaware

Ratepayers would pay
\$5,800
 over the next decade.
 Bills would increase **\$580**
 on average per year.

Delaware faces reliability and affordability challenges as electricity demand rises faster than new conventional generation can meet it. ACP analyzed the system under two scenarios—one with all resources available and another with no new clean energy projects beyond those already underway or mandated.

According to [a study by S&P](#), national electricity demand is projected to surge 35-50% by 2040, driven by domestic manufacturing growth, data centers, and mass electrification.

RELIABLE POWER FOR THE FIRST STATE

Electricity demand across the PJM Interconnection region, which includes the Delaware, is growing at an unprecedented pace, driven by rapid expansion of data centers, advanced manufacturing, electrification, and broader economic growth. **ACP analysis finds that without timely deployment of significant new clean energy resources, Mid-Atlantic and Midwest states — including Delaware— face serious reliability risks and dramatically higher electricity costs over the next decade.**

The growing mismatch between demand growth and new conventional generation presents an immediate challenge to grid reliability and affordability across the region. To evaluate system-wide impacts, ACP modeled PJM under two scenarios: a **base case**, where all generation resources are available, and a **no clean power case**, where no new wind, solar, or storage projects are added beyond those already under construction or required by law.

Delaware: Families of the Small Wonder Need Affordable Power

The result is that the average resident in Delaware will spend an additional \$5,800 over the next ten years if no new clean power is allowed to be built. \$5,800 is a significant additional cost to Delaware families who could spend that money on essential items like healthcare costs, home upgrades, or investments in their children.

If no new clean power is added, **rates in Delaware will increase by 95% by 2032** relative to the Base Case. That's over a \$16/kWh increase.

Rate Increase 2030-2035 for Delaware w/out Clean Power

The average residential customer in Delaware uses 11,000 kWh of electricity a year. The result is **the average Delaware resident will pay an additional \$3,000 from 2026-2032 and almost \$5,800 by 2035.**

By 2035, all ratepayers in PJM Interconnection would cumulatively pay an additional \$360 billion over the next 10 years.

These findings make clear that delaying clean energy deployment comes at a steep cost. Timely investment in wind, solar, and energy storage is essential to maintaining reliability, reducing dependence on imports, and protecting families and businesses from sharply higher electricity bills as demand continues to grow.
